

Custom Backyard Hydroponics Systems

By LMNdeavors, LLC

What is Hydroponics?

Hydroponics is a method of food production which uses no soil as the growing medium.

Hydroponic plants root into a small cube of growing blocks made from volcanic rocks.

Water and nutrients are circulated to the roots, which provide them all they need to flourish.

Are there advantages of Hydroponics growing methods over soil?

There are many advantages to using a nutrient mix ---

The nutrients are in solution and readily available;

NO WEEDS and no soil-borne pathogens!

Most well-designed hydroponics systems can produce far more food than could be achieved in the same amount of square feet.

All plants are above ground-level which reduces insect exposure and the need for pest mitigation, plus minimal bending to harvest!

What We Do:

We offer custom designed systems that start with a free site inspection

of possible installation locations in your yard.

There are many factors to consider, like accessibility, orientation to get the most sunlight, aesthetics and of course, your preferences.

We then provide the homeowner with a free quote and suggested design options.

The ultimate goal is providing the homeowner with abundant,

ultra-fresh herbs and produce on site, as well as a design that will be a conversation piece for friends and family.

Systems are installed in a manner which require no building permits and we've yet to find an H.O.A. that won't allow a small garden.

Our ongoing commitment to our Customers:

After installation, we provide starter plants, nutrient mix and everything your installation calls for to get you producing. This will be accomplished right after the system is up and running. Then, over the next 30 days, we will make 2 complimentary visits to top off water and nutrients and replace or add additional plants. During those visits, as well as after the installation, we will teach you how to utilize this growing technique -- Most customers are amazed at how simple it really is! After that, if you would like us to continue our twice monthly visits so that all you have to do is go out to your garden and harvest its bounty, we provide continuing service for \$75/month (and you can eliminate most of your produce bill).

Our Bigger Vision

Simply put, there are better ways to solve some of our challenges like knowing what is (or isn't) in our food; Freshness -- most produce loses the majority of its nutrients just a few days after harvest; Eliminating runoff which is significantly harming our local aquatic life; Food Security (most units produce more than a family can consume and sharing is noble) And assisting our customers in the transition from consumer to producer.

Customer Comments:

I don't have much of a "green-thumb" so when I was first approached regarding a hydroponic garden I wasn't sure it would be for me. However, with Joe's knowledge and excellent service we have had no issues with my new system. It really just grows without much intervention once Joe sets it up. He will also perform the required maintenance to the system which makes it as simple as going out and picking whatever I feel like eating that day. The system is a great investment if you enjoy fresh, organic, fruits, vegetables and herbs.

Sincerely, John J.

Melbourne, FL

Your next steps:

Discuss with family and friends. Does it make sense for you? Most of us realize we need to be a part of the solution but struggle with the "how". Call for a free, no obligation consultation. Then look forward to the best tasting, organic, healthy, fresh, nutrient-packed food you may have ever experienced. Enjoy the amazing flavor of super-fresh herbs in your favorite dishes and know that you have done something good.
